

Supplementary Fig. 1. Correlation between percentage of B-cells and their different subsets with rheumatoid arthritis disease activity, assessed with DAS28. Data are shown as the linear correlations (solid line) and their respective 95% confidence intervals (grey areas) for successive cycles (left panel) and naïve cycles (right panel). The ρ -coefficient and p-level were estimated with the Pearson test and statistical significance was set to p -level <0.005 (*) due to multiple comparisons.
