

Supplementary Fig. S1. Comparison of serum sIL-7R α levels between patients with early high BVAS and late low BVAS in AAV subtypes.

Serum sIL-7R α levels were significantly increased after treatment in MPA and GPA patients, and serum sIL-7R α levels in EGPA patients tended to increase after treatment, but were not statistically significant.

sIL-7R α : soluble interleukin-7 receptor alpha; BVAS: Birmingham vasculitis activity score; AAV: ANCA-associated vasculitis; MPA: microscopic polyangiitis; GPA: granulomatosis with polyangiitis; EGPA: eosinophilic granulomatosis with polyangiitis.
