

Supplementary Fig. S1. Dermatomyositis assessment of rash via telemedicine (DART): study design, procedures, and data collection.

CDASI: cutaneous dermatomyositis disease area and severity index; HAQ-DI: health assessment questionnaire-disability index; MD1: first rheumatologist; MD2: second rheumatologist; MMT-9: manual muscle testing-9; PhGA: physician global activity; PROMs: patient-reported outcome measures; PtGA: patient global activity; HIPAA: a Health Insurance Portability and Accountability Act.

Supplementary Fig. S2. A Bland-Altman plot between the two physicians (MD1 and MD2) log10 transformation of telemedicine cutaneous dermatomyositis disease area and severity index (CDASI).

A Bland-Altman plot between MD1 and MD2's log10 transformation of telemedicine CDASI revealed a mean difference of -0.08, with 95% limits of agreement of -0.58 and 0.42.

CDASI: cutaneous dermatomyositis disease area and severity index; MD1: first rheumatologist; MD2: second rheumatologist.
